SIT799 Human Aligned Artificial Intelligence

Credit Task 10.1: What new AI-related jobs will be created?

Overview

During week 10, you have explored the impact of mechanisation on employment in manual labour; explored the impact of automation on employment; explored the impact of AI on employment. We have also discussed realistic examples of jobs that can be replaced by AI.

In this task you need to find out a case study about a new AI-related Job, which does not exist today, and which could be in high demand in the coming years. This will help you to understand and reflect on the impact of AI on jobs. To complete this assignment, you need to refer back to Week 10 lecture material.

Submission Details

For this task you need to provide a case study about a new AI-related Job, which does not exist today, and which could be in high demand in the coming years – for example, AI data-curator, or AI data quality controller – and submit a report to OnTrack that outlines the following points:

- A discussion on the application of AI.
- A description of the new AI-related job.
- A discussion on why we need a dedicated person to fulfill this position.
- A discussion on the background and skills of the persons that can fit the position. For example, can we train and upskill a low-skilled person to fit the position? or do we need a highly trained person for that job?

Constraints

The submitted report should not exceed **600 words** in length. The report should have a **high-quality writing style**.
